## The 69th William Lowell Putnam Mathematical Competition Saturday, December 6, 2008

- A1 Let  $f: \mathbb{R}^2 \to \mathbb{R}$  be a function such that f(x,y) + f(y,z) + f(z,x) = 0 for all real numbers x,y, and z. Prove that there exists a function  $g: \mathbb{R} \to \mathbb{R}$  such that f(x,y) = g(x) g(y) for all real numbers x and y.
- A2 Alan and Barbara play a game in which they take turns filling entries of an initially empty  $2008 \times 2008$  array. Alan plays first. At each turn, a player chooses a real number and places it in a vacant entry. The game ends when all the entries are filled. Alan wins if the determinant of the resulting matrix is nonzero; Barbara wins if it is zero. Which player has a winning strategy?
- A3 Start with a finite sequence  $a_1, a_2, \ldots, a_n$  of positive integers. If possible, choose two indices j < k such that  $a_j$  does not divide  $a_k$ , and replace  $a_j$  and  $a_k$  by  $\gcd(a_j, a_k)$  and  $\gcd(a_j, a_k)$ , respectively. Prove that if this process is repeated, it must eventually stop and the final sequence does not depend on the choices made. (Note: gcd means greatest common divisor and lcm means least common multiple.)
- A4 Define  $f: \mathbb{R} \to \mathbb{R}$  by

$$f(x) = \begin{cases} x & \text{if } x \le e \\ xf(\ln x) & \text{if } x > e. \end{cases}$$

Does  $\sum_{n=1}^{\infty} \frac{1}{f(n)}$  converge?

- A5 Let  $n \geq 3$  be an integer. Let f(x) and g(x) be polynomials with real coefficients such that the points  $(f(1),g(1)),(f(2),g(2)),\ldots,(f(n),g(n))$  in  $\mathbb{R}^2$  are the vertices of a regular n-gon in counterclockwise order. Prove that at least one of f(x) and g(x) has degree greater than or equal to n-1.
- A6 Prove that there exists a constant c>0 such that in every nontrivial finite group G there exists a sequence of length at most  $c\ln |G|$  with the property that each element of G equals the product of some subsequence.

- (The elements of G in the sequence are not required to be distinct. A *subsequence* of a sequence is obtained by selecting some of the terms, not necessarily consecutive, without reordering them; for example, 4, 4, 2 is a subsequence of 2, 4, 6, 4, 2, but 2, 2, 4 is not.)
- B1 What is the maximum number of rational points that can lie on a circle in  $\mathbb{R}^2$  whose center is not a rational point? (A *rational point* is a point both of whose coordinates are rational numbers.)
- B2 Let  $F_0(x) = \ln x$ . For  $n \ge 0$  and x > 0, let  $F_{n+1}(x) = \int_0^x F_n(t) dt$ . Evaluate

$$\lim_{n\to\infty}\frac{n!F_n(1)}{\ln n}.$$

- B3 What is the largest possible radius of a circle contained in a 4-dimensional hypercube of side length 1?
- B4 Let p be a prime number. Let h(x) be a polynomial with integer coefficients such that  $h(0), h(1), \ldots, h(p^2-1)$  are distinct modulo  $p^2$ . Show that  $h(0), h(1), \ldots, h(p^3-1)$  are distinct modulo  $p^3$ .
- B5 Find all continuously differentiable functions  $f: \mathbb{R} \to \mathbb{R}$  such that for every rational number q, the number f(q) is rational and has the same denominator as q. (The denominator of a rational number q is the unique positive integer b such that q = a/b for some integer a with  $\gcd(a,b) = 1$ .) (Note:  $\gcd$  means greatest common divisor.)
- B6 Let n and k be positive integers. Say that a permutation  $\sigma$  of  $\{1,2,\ldots,n\}$  is k-limited if  $|\sigma(i)-i|\leq k$  for all i. Prove that the number of k-limited permutations of  $\{1,2,\ldots,n\}$  is odd if and only if  $n\equiv 0$  or  $1\pmod{2k+1}$ .
