Combinatorial representation theory

Representation theory: Given an algebra A ...

- What are the A -modules/representations?
(Actions $A \curvearrowright V$ and homomorphisms $\varphi : A \rightarrow \text{End}(V)$)
- What are the simple/indecomposable A -modules/ reps?
- What are their dimensions?
- What is the action of the center of A ?
- How can I combine modules to make new ones, and what are they in terms of the simple modules?

In **combinatorial** representation theory, we use combinatorial objects to index (construct a bijection to) modules and representations, and to encode information about them.

Motivating example: Schur-Weyl Duality

The **symmetric group** S_k (permutations) as diagrams:

(with multiplication given by concatenation)

Motivating example: Schur-Weyl Duality

$GL_n(\mathbb{C})$ acts on $\mathbb{C}^n \otimes \mathbb{C}^n \otimes \cdots \otimes \mathbb{C}^n = (\mathbb{C}^n)^{\otimes k}$ diagonally.

$$g \cdot (v_1 \otimes v_2 \otimes \cdots \otimes v_k) = gv_1 \otimes gv_2 \otimes \cdots \otimes gv_k.$$

S_k also acts on $(\mathbb{C}^n)^{\otimes k}$ by place permutation.

These actions commute!

Motivating example: Schur-Weyl Duality

Schur (1901): S_k and GL_n have commuting actions on $(\mathbb{C}^n)^{\otimes k}$.

Even better,

$$\underbrace{\text{End}_{GL_n} \left((\mathbb{C}^n)^{\otimes k} \right)}_{\text{(all linear maps that commute with } GL_n)} = \underbrace{\pi(\mathbb{C}S_k)}_{\text{(img of } S_k \text{ action)}} \quad \text{and} \quad \text{End}_{S_k} \left((\mathbb{C}^n)^{\otimes k} \right) = \underbrace{\rho(\mathbb{C}GL_n)}_{\text{(img of } GL_n \text{ action)}}.$$

Powerful consequence:

The double-centralizer relationship produces

$$(\mathbb{C}^n)^{\otimes k} \cong \bigoplus_{\lambda \vdash k} G^\lambda \otimes S^\lambda \quad \text{as a } GL_n\text{-}S_k \text{ bimodule,}$$

where G^λ are distinct irreducible GL_n -modules
 S^λ are distinct irreducible S_k -modules

For example,

$$\mathbb{C}^n \otimes \mathbb{C}^n \otimes \mathbb{C}^n = \left(G^{\square\square\square} \otimes S^{\square\square\square} \right) \oplus \left(G^{\square\square} \otimes S^{\square\square} \right) \oplus \left(G^{\square} \otimes S^{\square} \right)$$

Representation theory of $V^{\otimes k}$

$$V = \mathbb{C} = L(\square), \quad L(\square) \otimes L(\square) \otimes L(\square) \otimes L(\square) \otimes L(\square) \dots$$

More centralizer algebras

Brauer (1937)
 Orthogonal and symplectic groups
 (and Lie algebras) acting on
 $(\mathbb{C}^n)^{\otimes k}$ diagonally centralize
 the **Brauer algebra**:

Temperley-Lieb (1971)
 GL_2 and SL_2 (and \mathfrak{gl}_2 and \mathfrak{sl}_2) act-
 ing on $(\mathbb{C}^2)^{\otimes k}$ diagonally centralize
 the **Temperley-Lieb algebra**:

Diagrams encode maps $V^{\otimes k} \rightarrow V^{\otimes k}$ that commute with the
 action of some classical algebra.

More centralizer algebras

Representation theory of $V^{\otimes k}$, orthogonal and symplectic:
 $V = \mathbb{C} = L(\square)$, $L(\square) \otimes L(\square) \otimes L(\square) \otimes L(\square) \dots$

More diagram algebras: braids

The **braid group**:

(with multiplication given by concatenation)

More diagram algebras: braids

The **affine (one-pole) braid group**:

(with multiplication given by concatenation)

Quantum groups and braids

Fix $q \in \mathbb{C}$, and let $\mathcal{U} = \mathcal{U}_q \mathfrak{g}$ be the Drinfeld-Jimbo quantum group associated to Lie algebra \mathfrak{g} .

$\mathcal{U} \otimes \mathcal{U}$ has an invertible element $\mathcal{R} = \sum_{\mathcal{R}} R_1 \otimes R_2$ that yields a map

$$\check{\mathcal{R}}_{VW}: V \otimes W \longrightarrow W \otimes V$$

that (1) satisfies braid relations, and
 (2) commutes with the action on $V \otimes W$
 for any \mathcal{U} -module V .

The **two-pole** braid group shares a commuting action with \mathcal{U} on $M \otimes V^{\otimes k} \otimes N$:

| | Universal | Type B, C, D (orthog. & sympl.) | Type A (gen. & sp. linear) | Small Type A (GL ₂ & SL ₂) | |
|----------------|-----------------|------------------------------------|--|--|--|
| Quantum groups | Braid group | Brauer algebra | Sym. group | Temperley-Lieb | $\Lambda^{\otimes \dots \otimes \Lambda}$ $\Lambda \otimes \dots \otimes \Lambda$ |
| | Affine braids | BMW algebra | Hecke algebra $\text{crossing} = a \text{crossing} + \text{twists}$ | One-boundary TL | |
| | Two-pole braids | Two-pole BMW | Affine Hecke of type A (+twists) | Two-boundary TL | |
| Lie grp/alg | | | | | $V = \square$ $\Lambda^{\otimes \dots \otimes \Lambda}$ |

Nazarov (95): Introduced **degenerate affine Birman-Murakami-Wenzl (BMW) algebras**, built from Brauer algebras and their Jucys-Murphy elements.

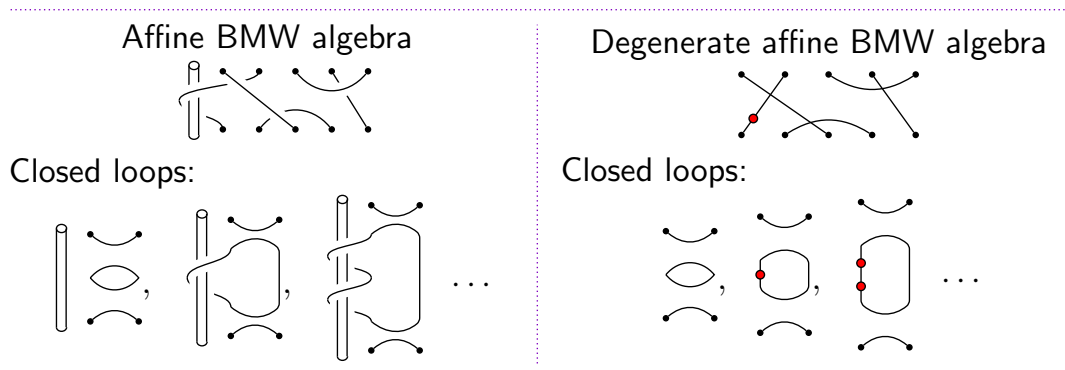

Häring-Oldenburg (98) and Orellana-Ram (04): Introduced the **affine BMW algebras**. [OR04] gave the action on $M \otimes V^{\otimes k}$ commuting with the action of the quantum groups of types B, C, D.

D.-Ram-Virk: Used these centralizer relationships to study these two algebras simultaneously. Results include **computing the centers**, handling the **parameters** associated to the algebras, computing powerful **intertwiner operators**, etc.

D.-González-Schneider-Sutton: Constructing 2-boundary analogues (in progress.).

Balogovic et al.: Signed versions and representations of periplectic Lie superalgebras.

Example: “Admissibility conditions”

The associated parameters of the algebra, e.g.

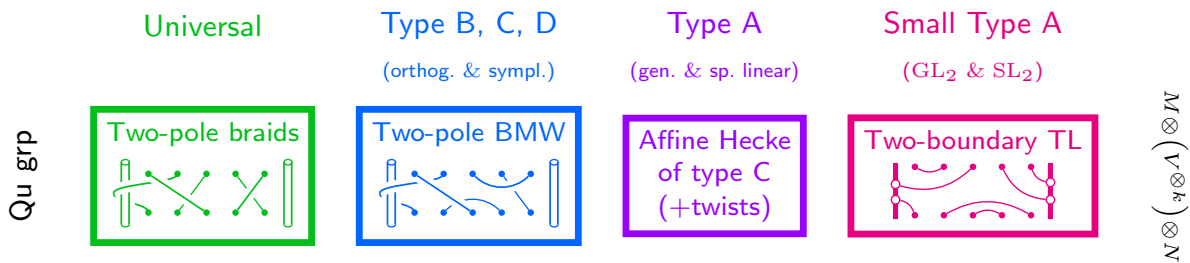

$$\begin{array}{c} \text{loop} \\ \text{---} \\ \text{---} \\ \text{---} \end{array} = z_0 \begin{array}{c} \text{---} \\ \text{---} \end{array}, \quad \begin{array}{c} \text{loop} \\ \text{---} \\ \text{---} \\ \text{---} \\ \text{---} \end{array} = z_1 \begin{array}{c} \text{---} \\ \text{---} \end{array}, \quad \begin{array}{c} \text{loop} \\ \text{---} \\ \text{---} \\ \text{---} \\ \text{---} \\ \text{---} \end{array} = z_2 \begin{array}{c} \text{---} \\ \text{---} \end{array}, \quad \dots$$

aren't entirely free.

Important insight: As operators on tensor space $M \otimes V \otimes V$,

$$\begin{array}{c} \top \\ \vdots \\ \ell \\ \vdots \\ \perp \end{array} \in Z(U\mathfrak{g}) \otimes \mathbb{C} \otimes \mathbb{C} \quad \text{and} \quad \begin{array}{c} \top \\ \vdots \\ \ell \\ \vdots \\ \perp \end{array} \in Z(U_q\mathfrak{g}) \otimes \mathbb{C} \otimes \mathbb{C}.$$

“Higher Casimir invariants”

Two boundary algebras (type A)

Nienhuis, de Gier, Batchelor (2004): Studying the six-vertex model with additional integrable boundary terms, introduced the **two-boundary Temperley-Lieb algebra** TL_k :

de Gier, Nichols (2008): Explored representation theory of TL_k using diagrams and established a connection to the affine Hecke algebras of type A and C.

D. (2010): The centralizer of \mathfrak{gl}_n acting on tensor space $M \otimes V^{\otimes k} \otimes N$ displays type C combinatorics for good choices of M , N , and V .

The **two-boundary (two-pole) braid group** \mathcal{B}_k is generated by

$$T_k = \begin{array}{c} \text{---} \\ | \\ \text{---} \end{array}, \quad T_0 = \begin{array}{c} \text{---} \\ | \\ \text{---} \end{array} \quad \text{and} \quad T_i = \begin{array}{c} \overset{i}{\bullet} \quad \overset{i+1}{\bullet} \\ \diagdown \quad \diagup \\ \bullet \quad \bullet \\ \underset{i}{\bullet} \quad \underset{i+1}{\bullet} \end{array} \quad \text{for } 1 \leq i \leq k-1,$$

subject to relations

i.e.

$$T_i T_{i+1} T_i = \begin{array}{c} \text{---} \\ | \\ \text{---} \end{array} = \begin{array}{c} \text{---} \\ | \\ \text{---} \end{array} = T_{i+1} T_i T_{i+1},$$

$$T_1 T_0 T_1 T_0 = \begin{array}{c} \text{---} \\ | \\ \text{---} \end{array} = \begin{array}{c} \text{---} \\ | \\ \text{---} \end{array} = T_0 T_1 T_0 T_1,$$

and, similarly, $T_{k-1} T_k T_{k-1} T_k = T_k T_{k-1} T_k T_{k-1}$.

(1) The **two-boundary (two-pole) braid group** \mathcal{B}_k is generated by

$$T_k = \begin{array}{c} \bullet \\ \diagup \quad \diagdown \\ \bullet \end{array}, \quad T_0 = \begin{array}{c} \bullet \\ \diagdown \quad \diagup \\ \bullet \end{array} \quad \text{and} \quad T_i = \begin{array}{c} \bullet \quad \bullet \\ \diagdown \quad \diagup \\ \bullet \quad \bullet \end{array} \quad \text{for } 1 \leq i \leq k-1,$$

subject to relations $\begin{array}{c} T_0 \\ \circ \end{array} \begin{array}{c} T_1 \\ \circ \end{array} \begin{array}{c} T_2 \\ \circ \end{array} \cdots \begin{array}{c} T_{k-2} \\ \circ \end{array} \begin{array}{c} T_{k-1} \\ \circ \end{array} \begin{array}{c} T_k \\ \circ \end{array}.$

(2) Fix constants $t_0, t_k, t \in \mathbb{C}$.

The **affine type C Hecke algebra** \mathcal{H}_k is the quotient of $\mathbb{C}\mathcal{B}_k$ by the relations

$$(T_0 - t_0^{1/2})(T_0 + t_0^{-1/2}) = 0, \quad (T_k - t_k^{1/2})(T_k + t_k^{-1/2}) = 0$$

$$\text{and} \quad (T_i - t^{1/2})(T_i + t^{-1/2}) = 0 \quad \text{for } i = 1, \dots, k-1.$$

(1) The **two-boundary (two-pole) braid group** \mathcal{B}_k is generated by

$$T_k = \begin{array}{c} \bullet \\ \diagup \quad \diagdown \\ \bullet \end{array}, \quad T_0 = \begin{array}{c} \bullet \\ \diagdown \quad \diagup \\ \bullet \end{array} \quad \text{and} \quad T_i = \begin{array}{c} \bullet \quad \bullet \\ \diagdown \quad \diagup \\ \bullet \quad \bullet \end{array} \quad \text{for } 1 \leq i \leq k-1,$$

subject to relations $\begin{array}{c} T_0 \\ \circ \end{array} \begin{array}{c} T_1 \\ \circ \end{array} \begin{array}{c} T_2 \\ \circ \end{array} \cdots \begin{array}{c} T_{k-2} \\ \circ \end{array} \begin{array}{c} T_{k-1} \\ \circ \end{array} \begin{array}{c} T_k \\ \circ \end{array}.$

(2) Fix constants $t_0, t_k, t = t_1 = t_2 = \dots = t_{k-1} \in \mathbb{C}$.

The **affine type C Hecke algebra** \mathcal{H}_k is the quotient of $\mathbb{C}\mathcal{B}_k$ by the relations $(T_i - t_i^{1/2})(T_i + t_i^{-1/2}) = 0$.

(3) Set

$$\begin{array}{c} \bullet \\ \diagdown \quad \diagup \\ \bullet \end{array} = t_0^{1/2} \begin{array}{c} \bullet \\ \diagup \quad \diagdown \\ \bullet \end{array} - \begin{array}{c} \bullet \\ \diagdown \quad \diagup \\ \bullet \end{array} \quad (e_0 = t_0^{1/2} - T_0)$$

$$\begin{array}{c} \bullet \\ \diagup \quad \diagdown \\ \bullet \end{array} = t_k^{1/2} \begin{array}{c} \bullet \\ \diagdown \quad \diagup \\ \bullet \end{array} - \begin{array}{c} \bullet \\ \diagup \quad \diagdown \\ \bullet \end{array} \quad (e_k = t_k^{1/2} - T_k)$$

$$\begin{array}{c} \bullet \quad \bullet \\ \diagdown \quad \diagup \\ \bullet \quad \bullet \end{array} = t^{1/2} \begin{array}{c} \bullet \\ \diagup \quad \diagdown \\ \bullet \end{array} - \begin{array}{c} \bullet \quad \bullet \\ \diagdown \quad \diagup \\ \bullet \quad \bullet \end{array} \quad (e_i = t^{1/2} - T_i)$$

so that $e_j^2 = z_j e_j$ (for good z_j).

The **two-boundary Temperley-Lieb algebra** is the quotient of \mathcal{H}_k by the relations $e_i e_{i\pm 1} e_i = e_i$ for $i = 1, \dots, k-1$.

Theorem (D.-Ram)

- (1) Let $U = U_q \mathfrak{g}$ for any complex reductive Lie algebras \mathfrak{g} .
Let $M, N,$ and V be finite-dimensional modules.
The two-boundary braid group B_k acts on $M \otimes (V)^{\otimes k} \otimes N$ and this action commutes with the action of U .
- (2) If $\mathfrak{g} = \mathfrak{gl}_n$, then (for correct choices of $M, N,$ and V),
the affine Hecke algebra of type C, H_k , acts on $M \otimes (V)^{\otimes k} \otimes N$
and this action commutes with the action of U .
- (3) If $\mathfrak{g} = \mathfrak{gl}_2$, then the action of the two-boundary Temperley-Lieb algebra factors through the T.L. quotient of H_k .

Some results:

- (a) A diagrammatic intuition for H_k .
- (b) A combinatorial classification and construction of irreducible representations of H_k (type C with distinct parameters) via central characters and generalizations of Young tableaux.
- (c) A classification of the representations of TL_k in [dGN08] via central characters, including answers to open questions and conjectures regarding their irreducibility and isomorphism classes.

Jucys-Murphy elements:

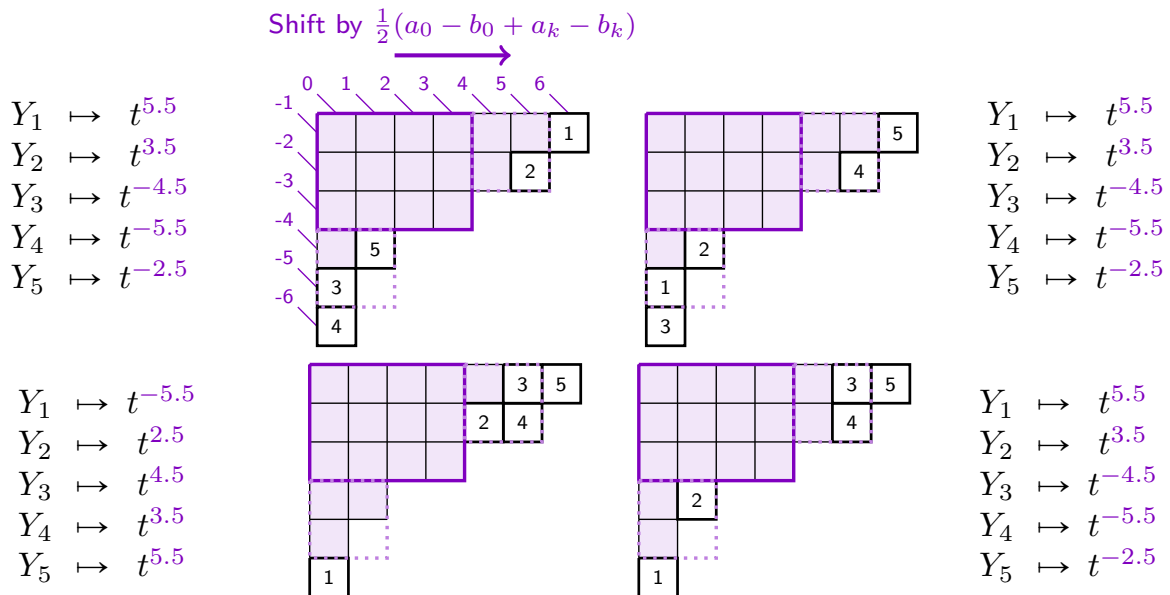

- ▶ Pairwise commute
- ▶ $Z(\mathcal{H}_k)$ is (type-C) symmetric Laurent polynomials in Z_i 's
- ▶ Central characters indexed by $\mathbf{c} \in \mathbb{C}^k$ (modulo signed permutations)

Exploring $M \otimes N \otimes L(\square)^{\otimes k}$

$$L\left(\begin{array}{|c|c|c|c|} \hline \square & \square & \square & \square \\ \hline \square & \square & \square & \square \\ \hline \square & \square & \square & \square \\ \hline \square & \square & \square & \square \\ \hline \end{array}\right) \otimes L\left(\begin{array}{|c|c|} \hline \square & \square \\ \hline \square & \square \\ \hline \end{array}\right) \otimes L(\square) \otimes L(\square) \otimes L(\square) \otimes L(\square) \otimes L(\square) \otimes L(\square)$$

- (*) H_k representations in tensor space are labeled by certain partitions λ .
- (*) Basis labeled by tableaux from *some* partition μ in $(a^c) \otimes (b^d)$ to λ .
- (*) Calibrated (Y_i 's are diagonalized): Y_i acts by t to the shifted diagonal number of box_i . (Think: signed permutations.)
