What were the best features of the course/instructor?

Professor Daugherty obviously enjoys math and cares a lot about about us as students. She is passionate about the subject, but more importantly, is easier to relate to as a learner than some of the more experienced math professors. She understands where and how we get stuck and is able to help us through it. Other professors have not

What were the worst features of the course/instructor?

She was not as precise as some of the other professors I've had, but if you have some experience this doesn't matter as much (as long as it won't just bug the heck out of you). I'd rather be able to understand her explanations and ask for clarification than listen to a professor that's theoretically perfect but I can't understand and they can't help me, as well. been able to do this for me.

What advice would you give to a fellow student considering taking this course? I think she struggles

Not too bad if you've taken a lot of math. I would recommend a differential class for "intro to proofs," because a lot of them are similar, and I think it works better as an easier course for later in the major/minor.
