# Antiderivatives and Initial Value Problems

10/19/2011

If 
$$\frac{d}{dx}f(x) = 2x$$
, what is  $f(x)$ ?

Can you think of another function that f(x) could be?

If 
$$\frac{d}{dx}f(x) = 3x^2 + 1$$
, what is  $f(x)$ ?

Can you think of another function that f(x) could be?

An **antiderivative** of a function f on an interval I is another function F such that F'(x) = f(x) for all  $x \in I$ .

An **antiderivative** of a function f on an interval I is another function F such that F'(x) = f(x) for all  $x \in I$ .

### **Examples:**

1. An antiderivative of f(x) = 2x is  $F(x) = x^2$ .

An **antiderivative** of a function f on an interval I is another function F such that F'(x) = f(x) for all  $x \in I$ .

- 1. An antiderivative of f(x) = 2x is  $F(x) = x^2$ .
- 2. Another antiderivative of f(x) = 2x is  $F(x) = x^2 + 1$ .

An **antiderivative** of a function f on an interval I is another function F such that F'(x) = f(x) for all  $x \in I$ .

- 1. An antiderivative of f(x) = 2x is  $F(x) = x^2$ .
- 2. Another antiderivative of f(x) = 2x is  $F(x) = x^2 + 1$ .
- 3. There are *lots* of antiderivatives of f(x) = 2x which look like  $F(x) = x^2 + c$ .

Suppose that h is differentiable in an interval I, and h'(x) = 0 for all x in I.

Then h is a constant function! i.e. h(x) = C for all  $x \in I$ , where c is a constant.

So, if F(x) is one antiderivative of f(x), then any other antiderivative must be of the form F(x) + c.

Suppose that h is differentiable in an interval I, and h'(x) = 0 for all x in I.

Then h is a constant function! i.e. h(x) = C for all  $x \in I$ , where c is a constant.

So, if F(x) is one antiderivative of f(x), then any other antiderivative must be of the form F(x) + c.

**Example:** All of the antiderivatives of f(x) = 2x look like

$$F(x) = x^2 + c$$

for some constant c.

Every function f that has at least one antiderivative F has **infinitely many** antiderivatives

$$F(x) + c$$
.

Every function f that has at least one antiderivative F has **infinitely many** antiderivatives

$$F(x) + c$$
.

We refer to F(x) + c as the

general antiderivative or the indefinite integral

and denote it by

$$F(x) + c = \int f(x) dx.$$

Every function f that has at least one antiderivative F has **infinitely many** antiderivatives

$$F(x) + c$$
.

We refer to F(x) + c as the

general antiderivative or the indefinite integral

and denote it by

$$F(x)+c=\int f(x)\mathrm{d}x.$$

**Example:** 

$$\int 2x \ dx = x^2 + c.$$

$$\int x^2 \ dx = \frac{1}{3}x^3 + c, \qquad \text{because} \qquad \frac{d}{dx}(\frac{1}{3}x^3 + c) = \frac{1}{3} * 3x^2 = x^2$$

$$\int x^2 dx = \frac{1}{3}x^3 + c, \qquad \text{because} \qquad \frac{d}{dx}(\frac{1}{3}x^3 + c) = \frac{1}{3} * 3x^2 = x^2$$

$$\int x^3 dx = \frac{1}{4}x^4 + c, \qquad \text{because} \qquad \frac{d}{dx}(\frac{1}{4}x^4 + c) = \frac{1}{4} * 4x^3 = x^3$$

$$\int x^{2} dx = \frac{1}{3}x^{3} + c, \qquad \text{because} \qquad \frac{d}{dx}(\frac{1}{3}x^{3} + c) = \frac{1}{3} * 3x^{2} = x^{2}$$

$$\int x^{3} dx = \frac{1}{4}x^{4} + c, \qquad \text{because} \qquad \frac{d}{dx}(\frac{1}{4}x^{4} + c) = \frac{1}{4} * 4x^{3} = x^{3}$$

$$\int x^{5} dx =$$

$$\int x^{-3} dx =$$

$$\int x^{k} dx =$$

$$\int x^{k} dx = \frac{1}{k+1}x^{k+1} + c$$
 if  $k \neq -1$   
$$\int x^{-1} dx =$$

$$\int x^k dx = \frac{1}{k+1} x^{k+1} + c \qquad \text{if } k \neq -1$$

$$\int x^{-1} dx = \ln(x) + c \qquad \text{b/c } \frac{d}{dx} \ln(x) = x^{-1}$$

$$\int x^{k} dx = \frac{1}{k+1}x^{k+1} + c \qquad \text{if } k \neq -1$$

$$\int x^{-1} dx = \ln(x) + c \qquad \text{b/c } \frac{d}{dx}\ln(x) = x^{-1}$$

$$\int \sin(x) dx =$$

if  $k \neq -1$ 

$$\int \cos(x) \ dx =$$

$$\int e^{x} \ dx =$$

 $\int \sec^2(x) \ dx =$ 

# Theorem (Opposite of sum and constant rules)

Suppose the functions f and g both have antiderivatives on the interval I. Then for any constants a and b, the function af + bg has an antiderivative on I and

$$\int (a*f(x)+b*g(x))dx = a \int f(x)dx + b \int g(x)dx$$

We did

"Solve the differential equation  $\frac{d}{dx}y = y$ ."

Answer:  $y = ce^x$ 

We did

"Solve the differential equation 
$$\frac{d}{dx}y = y$$
."

Answer:  $y = ce^x$ 

Finding an antiderivative can also be thought of as solving a differential equation:

"Solve the differential equation  $\frac{d}{dx}y = x^2$ ."

Answer: 
$$y = \int x^2 dx = \frac{1}{3}x^3 + c$$
.

We did

"Solve the differential equation 
$$\frac{d}{dx}y = y$$
."

Answer:  $y = ce^x$ 

Finding an antiderivative can also be thought of as solving a differential equation:

"Solve the differential equation  $\frac{d}{dx}y = x^2$ ."

Answer: 
$$y = \int x^2 dx = \frac{1}{3}x^3 + c$$
.

In general, equations that involve  $x, y, \frac{dy}{dx}, \frac{d^2y}{dx^2}, \ldots$  are called differential equations.

We did

"Solve the differential equation 
$$\frac{d}{dx}y = y$$
."

Answer:  $y = ce^x$ 

Finding an antiderivative can also be thought of as solving a differential equation:

"Solve the differential equation  $\frac{d}{dx}y = x^2$ ."

Answer: 
$$y = \int x^2 dx = \frac{1}{3}x^3 + c$$
.

In general, equations that involve  $x, y, \frac{dy}{dx}, \frac{d^2y}{dx^2}, \ldots$  are called differential equations.

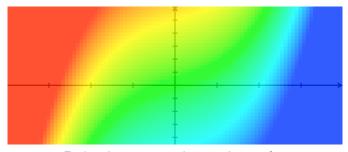

To solve: find a function f(x) that satisfies the equation identically when substituted for the unknown function y, i.e. let y = f(x).

Solve the differential equation 
$$y' = 2x + sinx$$
.

Solve the differential equation 
$$\frac{d^2y}{dx^2} + y = 0.$$

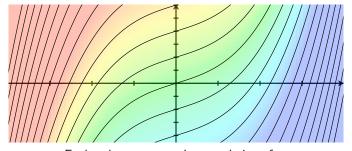

general solution: 
$$y = \frac{1}{3}x^3 + x + c$$

general solution: 
$$y = \frac{1}{3}x^3 + x + c$$

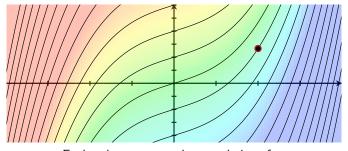

Each color corresponds to a choice of c.

general solution: 
$$y = \frac{1}{3}x^3 + x + c$$

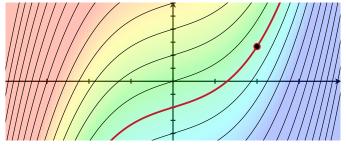

Each color corresponds to a choice of c.

general solution: 
$$y = \frac{1}{3}x^3 + x + c$$

Each color corresponds to a choice of c.

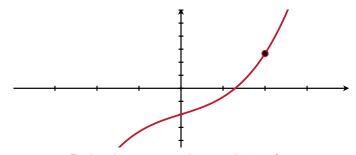

general solution: 
$$y = \frac{1}{3}x^3 + x + c$$

Each color corresponds to a choice of *c*. Red cuve is the *particular* solution.

general solution: 
$$y = \frac{1}{3}x^3 + x + c$$

particular solution:  $y = \frac{1}{3}x^3 + x - 2$ 

Each color corresponds to a choice of *c*. Red cuve is the *particular* solution.

An **initial-value problem** is a differential equation together with enough additional conditions to specify the constants of integration that appear in the general solution.

The particular solution of the problem is then a function that satisfies both the differential equation and also the additional conditions.

$$\frac{dy}{dx} = 2x + \sin(x)$$

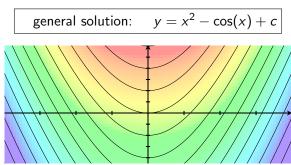

$$\frac{dy}{dx} = 2x + \sin(x)$$

general solution: 
$$y = x^2 - \cos(x) + c$$

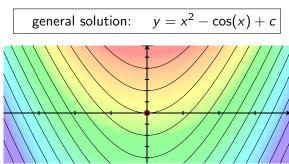

$$\frac{dy}{dx} = 2x + \sin(x)$$

general solution: 
$$y = x^2 - \cos(x) + c$$

$$\frac{dy}{dx} = 2x + \sin(x)$$

$$\frac{dy}{dx} = 2x + \sin(x)$$

Solve the initial value problem

$$\frac{dy}{dx} = 2x + \sin(x)$$

subject to y(0) = 0.

general solution: 
$$y = x^2 - \cos(x) + c$$

Algebraically: get a particular solution by solving 
$$\mathbf{0} = \mathbf{y}(\mathbf{0}) = (0)^2 - \cos(0) + c = -1 + c$$
 (for c)

Solve the initial value problem

$$\frac{dy}{dx} = 2x + \sin(x)$$

subject to y(0) = 0.

general solution:  $y = x^2 - \cos(x) + c$ 

Algebraically: get a particular solution by solving 
$$\mathbf{0} = \mathbf{y}(\mathbf{0}) = (0)^2 - \cos(0) + c = -1 + c$$
 (for c)

$$c = 1$$
, so  $y = x^2 - \cos(x) + 1$ .

Solve the initial value problem

$$\frac{dy}{dx} = 2x + \sin(x)$$

subject to y(0) = 0.

general solution: 
$$y = x^2 - \cos(x) + c$$

Algebraically: get a particular solution by solving  $\mathbf{0} = \mathbf{y}(\mathbf{0}) = (0)^2 - \cos(0) + c = -1 + c$  (for c)

$$c = 1$$
, so  $y = x^2 - \cos(x) + 1$ .

Solve the initial-value problem  $y'' = \cos x$ ,  $y'(\frac{\pi}{2}) = 2$ ,  $y(\frac{\pi}{2}) = 3\pi$ .

Solve the initial-value problem  $y'' = \cos x$ ,  $y'(\frac{\pi}{2}) = 2$ ,  $y(\frac{\pi}{2}) = 3\pi$ .

Step 1: Calculate the antiderivative of cos(x) to find the general solution for y'.

Step 2: Plug in the values  $y'(\frac{\pi}{2}) = 2$  to calculate c.

Step 3: Write down the *particular* solution for y'.

Step 4: Calculate the antiderivative of your particular solution in Step 3 to find the *general solution for y*.

Step 5: Plug in the values  $y(\frac{\pi}{2}) = 3\pi$  to solve for the new constant.

Step 6: Write down the particular solution for y.

An object dropped from a cliff has acceleration  $a = -9.8 \ m/sec^2$  under the influence of gravity. What is the function s(t) that models its height at time t?

# Initial value problem:

Solve

$$\frac{d^2s}{dt^2} = -9.8, \qquad s(0) = s_0, \ s'(0) = 0.$$

An object dropped from a cliff has acceleration  $a = -9.8 \ m/sec^2$  under the influence of gravity. What is the function s(t) that models its height at time t?

# Initial value problem:

Solve

$$\frac{d^2s}{dt^2} = -9.8, s(0) = s_0, s'(0) = 0.$$

An object dropped from a cliff has acceleration  $a = -9.8 \ m/sec^2$  under the influence of gravity. What is the function s(t) that models its height at time t?

### Initial value problem:

Solve

$$\frac{d^2s}{dt^2} = -9.8, \qquad s(0) = s_0, \ s'(0) = 0.$$

Suppose that a baseball is thrown upward from the roof of a 100 meter high building. It hits the street below eight seconds later. What was the initial velocity of the baseball, and how high did it rise above the street before beginning its descent?

## Initial value problem:

Solve

$$\frac{d^2s}{dt^2} = -9.8, \quad s(0) = 100, \ s(8) = 0.$$

- (1) calculate s'(0), and
- (2) solve  $s'(t_1) = 0$  for  $t_1$  and calculate  $s(t_1)$ .

Suppose that a baseball is thrown upward from the roof of a 100 meter high building. It hits the street below eight seconds later. What was the initial velocity of the baseball, and how high did it rise above the street before beginning its descent?

#### Initial value problem:

Solve

$$\frac{d^2s}{dt^2} = -9.8,$$
  $s(0) = 100, s(8) = 0.$ 

- (1) calculate s'(0), and
- (2) solve  $s'(t_1) = 0$  for  $t_1$  and calculate  $s(t_1)$ .

Suppose that a baseball is thrown upward from the roof of a 100 meter high building. It hits the street below eight seconds later. What was the initial velocity of the baseball, and how high did it rise above the street before beginning its descent?

### **Initial value problem:**

Solve

$$\frac{d^2s}{dt^2} = -9.8,$$
  $s(0) = 100, s(8) = 0.$ 

- (1) calculate s'(0), and
- (2) solve  $s'(t_1) = 0$  for  $t_1$  and calculate  $s(t_1)$ .
