Antiderivative of 1/x

Antiderivative of 1/x

Antiderivative of 1/x

Warm up: Decide whether each statement is true or false by taking a derivative of the RHS and seeing if it's the function inside the integral. **If false**, calculate the real antiderivative.

1.
$$\int \frac{1}{3x+5} dx = \frac{1}{3} \ln |3x+5| + C$$

2.
$$\int e^{4x} dx = e^{4x} + C$$

3.
$$\int \frac{1}{e^x} dx = \ln |e^x| + C$$

[hints: $e^x > 0$, so $\ln |e^x| = \ln(e^x)$. Also, $1/e^x = e^{-x}$]

4.
$$\int \cos(-14x + 32) \ dx = -\frac{1}{14}\sin(-14x + 32) + C$$

5.
$$\int \frac{1}{2x} dx = \frac{1}{2} \ln(2x) + C$$

Warm up: Decide whether each statement is true or false by taking a derivative of the RHS and seeing if it's the function inside the integral. **If false**, calculate the real antiderivative.

1.
$$\int \frac{1}{3x+5} dx = \frac{1}{3} \ln |3x+5| + C$$

True!
2.
$$\int e^{4x} dx = e^{4x} + C$$

False! $\frac{d}{dx} e^{4x} = 4e^{4x}$, so $\int e^{4x} dx = \frac{1}{4}e^{4x} + C$
3.
$$\int \frac{1}{e^x} dx = \ln |e^x| + C$$

[hints: $e^x > 0$, so $\ln |e^x| = \ln(e^x)$. Also, $1/e^x = e^{-x}$]
False! $\int \frac{1}{e^x} dx = \int e^{-x} dx = -e^{-x} + C$
4.
$$\int \cos(-14x+32) dx = -\frac{1}{14} \sin(-14x+32) + C$$

True!
5.
$$\int \frac{1}{2x} dx = \frac{1}{2} \ln(2x) + C$$

False! $\int \frac{1}{2x} dx = \frac{1}{2} \ln |2x| + C$

Review of antiderivatives we know so far

$$\int x^{a} dx = \frac{1}{a+1}x^{a+1} + C$$

$$\int \int \sec^{2}(x) dx = \tan(x) + C$$

$$\int \frac{1}{x} dx = \ln|x| + C$$

$$\int \csc^{2}(x) dx = -\cot(x) + C$$

$$\int e^{x} dx = e^{x} + C$$

$$\int \sec(x) \tan(x) dx = \sec(x) + C$$

$$\int \sin(x) dx = -\cos(x) + C$$

$$\int \csc(x) \cot(x) dx = -\csc(x) + C$$

$$\int \cos(x) dx = \sin(x) + C$$

If F'(x) = f(x) and G'(x) = g(x), and a and b are constants, then

$$\int \left(a * f(x) + b * g(x)\right) dx = a * F(x) + b * G(x) + C$$

and $\int f(a * x + b) dx = \frac{1}{a} f(a * x + b) + C$

The plan:

- 1. Put it into math, i.e. Write down an initial value problem.
- 1'. Look at slope fields to make sure the IVP makes sense.
- 2. Find the general solution to the IVP.
- 3. Plug in the points and find the particular solution.
- 4. Calculate the value of the solution when t = 24.

The plan:

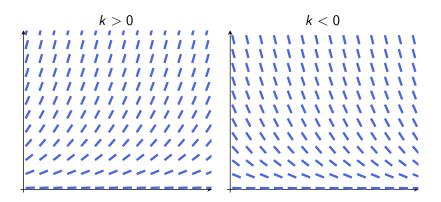

- 1. Put it into math, i.e. Write down an initial value problem.
- 1'. Look at slope fields to make sure the IVP makes sense.
- 2. Find the general solution to the IVP.
- 3. Plug in the points and find the particular solution.
- 4. Calculate the value of the solution when t = 24.

Step 1: Put into math. Initial value problem:

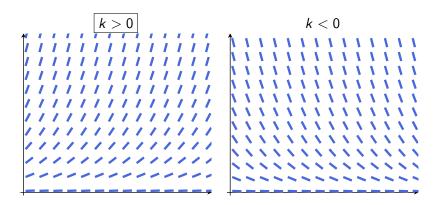

$$\frac{dy}{dt} = ky, \qquad y(0) = 700, \quad y(12) = 900$$

$$\frac{dy}{dt} = ky,$$
 $y(0) = 700,$ $y(12) = 900$

 $\frac{dy}{dt} = ky, \qquad y(0) = 700, \quad y(12) = 900$

 $\frac{dy}{dt} = ky,$ y(0) = 700, y(12) = 900

$$\frac{dy}{dt} = ky,$$
 $y(0) = 700,$ $y(12) = 900$

$$\frac{dy}{dt} = ky,$$
 $y(0) = 700,$ $y(12) = 900$

$$\int \frac{1}{y} dy = \int k \, dt$$

$$\frac{dy}{dt} = ky,$$
 $y(0) = 700,$ $y(12) = 900$

$$\int \frac{1}{y} dy = \int k \, dt$$

LHS: $\int \frac{1}{y} dy = \ln |y| + c_1$

$$\frac{dy}{dt} = ky,$$
 $y(0) = 700,$ $y(12) = 900$

$$\int \frac{1}{y} dy = \int k \, dt$$

LHS: $\int \frac{1}{y} dy = \ln |y| + c_1$ RHS: $\int k dt = kt + c_2$

$$\frac{dy}{dt} = ky, \qquad y(0) = 700, \quad y(12) = 900$$

$$\int \frac{1}{y} dy = \int k dt$$

LHS: $\int \frac{1}{y} dy = \ln |y| + c_1$ RHS: $\int k dt = kt + c_2$ Putting it together:

 $\ln|y| = kt + C$

$$\frac{dy}{dt} = ky, \qquad y(0) = 700, \quad y(12) = 900$$

$$\int \frac{1}{y} dy = \int k \, dt$$

LHS: $\int \frac{1}{y} dy = \ln |y| + c_1$ RHS: $\int k dt = kt + c_2$ Putting it together:

$$\ln |y| = kt + C \implies |y| = e^{kt+C} = e^C * e^{kt}$$

$$\frac{dy}{dt} = ky, \qquad y(0) = 700, \quad y(12) = 900$$

$$\int \frac{1}{y} dy = \int k dt$$

LHS: $\int \frac{1}{y} dy = \ln |y| + c_1$ RHS: $\int k dt = kt + c_2$ Putting it together:

$$\ln |y| = kt + C \implies |y| = e^{kt+C} = e^C * e^{kt}$$
$$\implies y = \pm e^C * e^{kt} = Ae^{kt}.$$

$$\frac{dy}{dt} = ky, \qquad y(0) = 700, \quad y(12) = 900$$

$$\int \frac{1}{y} dy = \int k \, dt$$

LHS: $\int \frac{1}{y} dy = \ln |y| + c_1$ RHS: $\int k dt = kt + c_2$ Putting it together:

$$\ln |y| = kt + C \implies |y| = e^{kt+C} = e^C * e^{kt}$$
$$\implies y = \pm e^C * e^{kt} = Ae^{kt}.$$

General solution: y = A

$$y = Ae^{kt}$$

$$\frac{dy}{dt} = ky, \qquad y(0) = 700, \quad y(12) = 900$$

General solution: $y = Ae^{kt}$

$$\frac{dy}{dt} = ky, \qquad y(0) = 700, \quad y(12) = 900$$

General solution: $y = Ae^{kt}$

$$\frac{dy}{dt} = ky, \qquad y(0) = 700, \quad y(12) = 900$$

General solution: $y = Ae^{kt}$

$$700 = y(0) = Ae^0 = A$$
, so $y = 700e^{kt}$

$$\frac{dy}{dt} = ky, \qquad y(0) = 700, \quad y(12) = 900$$

General solution: $y = Ae^{kt}$

$$700 = y(0) = Ae^0 = A$$
, so $y = 700e^{kt}$

$$900 = 700e^{12k} \implies 12k = \ln(900/700) = \ln(9/7)$$
$$\implies k = \frac{1}{12}\ln(9/7) \approx \boxed{0.021}$$

$$\frac{dy}{dt} = ky, \qquad y(0) = 700, \quad y(12) = 900$$

General solution: $y = Ae^{kt}$

$$700 = y(0) = Ae^0 = A$$
, so $y = 700e^{kt}$

$$900 = 700e^{12k} \implies 12k = \ln(900/700) = \ln(9/7)$$
$$\implies k = \frac{1}{12}\ln(9/7) \approx \boxed{0.021}$$

Particular solution:
$$y = 700e^{t*\frac{1}{12}\ln(9/7)}$$

$$\frac{dy}{dt} = ky, \qquad y(0) = 700, \quad y(12) = 900$$

General solution: $y = Ae^{kt}$

$$700 = y(0) = Ae^0 = A$$
, so $y = 700e^{kt}$

$$900 = 700e^{12k} \implies 12k = \ln(900/700) = \ln(9/7)$$
$$\implies k = \frac{1}{12}\ln(9/7) \approx \boxed{0.021}$$

Particular solution:
$$y = 700e^{t*\frac{1}{12}\ln(9/7)}$$

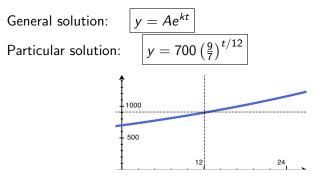

Note: another way to write this is

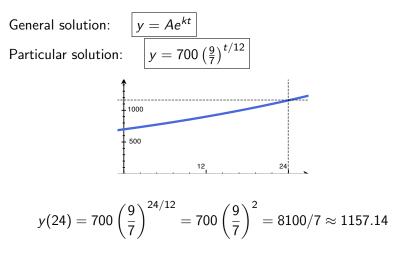

$$y = 700e^{t*\frac{1}{12}\ln(9/7)} = 700\left(e^{\ln(9/7)}\right)^{t/12} = 700\left(\frac{9}{7}\right)^{t/12}$$

General solution:

Particular solution:

$$y = Ae^{kt}$$
$$y = 700 \left(\frac{9}{7}\right)^{t/12}$$

Example 2: Objects heat or cool at a rate proportional to the difference between their temperature and the ambient temperature. Suppose a pie is pulled out of the oven (heated to 370° F), and put into a room that's 70° F. After 10 minutes, the center of the pie is 340° F.

- (a) How hot is the pie after 20 minutes?
- (b) How long will it take for the center of the pie to cool to 100° F?

Example 2: Objects heat or cool at a rate proportional to the difference between their temperature and the ambient temperature. Suppose a pie is pulled out of the oven (heated to 370°F), and put into a room that's 70°F. After 10 minutes, the center of the pie is 340°F.

- (a) How hot is the pie after 20 minutes?
- (b) How long will it take for the center of the pie to cool to 100° F?

The plan:

- 1. Put it into math, i.e. Write down an initial value problem.
- 2. Find the general solution to the IVP.
- 3. Plug in the points and find the particular solution.
- 4. Calculate the value of the solution when t = 20.
- 5. Solve for t when the solution is equal to 100.

Example 2: Objects heat or cool at a rate proportional to the difference between their temperature and the ambient temperature. Suppose a pie is pulled out of the oven (heated to 370°F), and put into a room that's 70°F. After 10 minutes, the center of the pie is 340°F.

- (a) How hot is the pie after 20 minutes?
- (b) How long will it take for the center of the pie to cool to 100° F?

The plan:

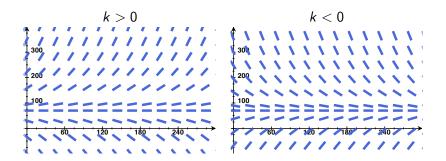

- 1. Put it into math, i.e. Write down an initial value problem.
- 2. Find the general solution to the IVP.
- 3. Plug in the points and find the particular solution.
- 4. Calculate the value of the solution when t = 20.
- 5. Solve for t when the solution is equal to 100.

Step 1: Put into math. Initial value problem:

$$\frac{dy}{dt} = k(y - 70), \qquad y(0) = 370, \quad y(10) = 340$$

IVP:
$$\frac{dy}{dt} = k(y - 70), \qquad y(0) = 370, \quad y(10) = 340$$

IVP:
$$\frac{dy}{dt} = k(y - 70), \qquad y(0) = 370, \quad y(10) = 340$$

IVP:
$$\frac{dy}{dt} = k(y - 70), \qquad y(0) = 370, \quad y(10) = 340$$

IVP:
$$\frac{dy}{dt} = k(y - 70), \qquad y(0) = 370, \quad y(10) = 340$$

$$\int \frac{1}{y - 70} dy = \int k \, dt$$

IVP:
$$\frac{dy}{dt} = k(y - 70), \qquad y(0) = 370, \quad y(10) = 340$$

$$\int \frac{1}{y - 70} dy = \int k \, dt$$

LHS:
$$\int \frac{1}{y-70} dy = \ln |y-70| + c_1$$
,

IVP:
$$\frac{dy}{dt} = k(y - 70), \qquad y(0) = 370, \quad y(10) = 340$$

$$\int \frac{1}{y-70} dy = \int k \, dt$$

LHS:
$$\int \frac{1}{y-70} dy = \ln |y-70| + c_1$$
,

RHS:
$$\int kdt = kt + c_2$$

IVP:
$$\frac{dy}{dt} = k(y - 70), \qquad y(0) = 370, \quad y(10) = 340$$

$$\int \frac{1}{y - 70} dy = \int k \, dt$$

LHS:
$$\int \frac{1}{y-70} dy = \ln |y-70| + c_1$$
,

RHS:
$$\int kdt = kt + c_2$$

Putting it together: $\ln |y - 70| = kt + c$ (where $c = c_2 - c_1$).

IVP:
$$\frac{dy}{dt} = k(y - 70), \qquad y(0) = 370, \quad y(10) = 340$$

$$\int \frac{1}{y - 70} dy = \int k \, dt$$

LHS:
$$\int \frac{1}{y-70} dy = \ln |y-70| + c_1$$
,

RHS:
$$\int kdt = kt + c_2$$

Putting it together: $\ln |y - 70| = kt + c$ (where $c = c_2 - c_1$). So

$$y-70=\pm e^{kt+c}$$

IVP:
$$\frac{dy}{dt} = k(y - 70), \qquad y(0) = 370, \quad y(10) = 340$$

$$\int \frac{1}{y - 70} dy = \int k \, dt$$

LHS:
$$\int \frac{1}{y-70} dy = \ln |y-70| + c_1$$
,

RHS:
$$\int kdt = kt + c_2$$

Putting it together: $\ln |y - 70| = kt + c$ (where $c = c_2 - c_1$). So

$$y-70=\pm e^{kt+c}=\pm e^c*e^{kt}=Ae^{kt}$$
 where $A=\pm e^c,$

IVP:
$$\frac{dy}{dt} = k(y - 70), \qquad y(0) = 370, \quad y(10) = 340$$

$$\int \frac{1}{y-70} dy = \int k \, dt$$

LHS:
$$\int \frac{1}{y-70} dy = \ln |y-70| + c_1$$
,

RHS:
$$\int kdt = kt + c_2$$

Putting it together: $\ln |y - 70| = kt + c$ (where $c = c_2 - c_1$). So

$$y-70=\pm e^{kt+c}=\pm e^{c}*e^{kt}=Ae^{kt}$$
 where $A=\pm e^{c},$

and so

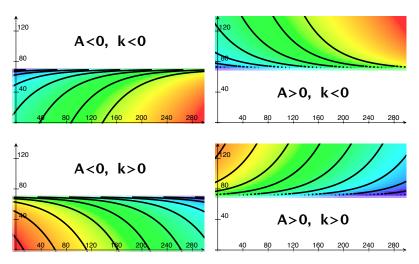

$$y = Ae^{kt} + 70$$

IVP:
$$\frac{dy}{dt} = k(y - 70),$$
 $y(0) = 370,$ $y(10) = 340$
General solution: $y = Ae^{kt} + 70$

What do we expect from k and A?

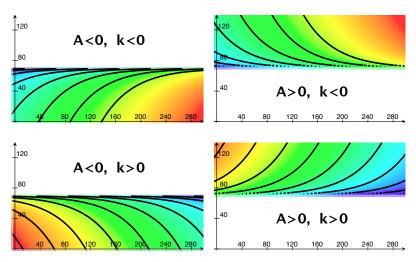

IVP:
$$\frac{dy}{dt} = k(y - 70),$$
 $y(0) = 370,$ $y(10) = 340$
General solution: $y = Ae^{kt} + 70$

What do we expect from k and A?

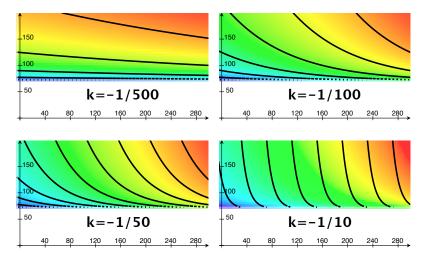

IVP:
$$\frac{dy}{dt} = k(y - 70),$$
 $y(0) = 370,$ $y(10) = 340$
General solution: $y = Ae^{kt} + 70$

What do we expect from k and A? A > 0, k < 0

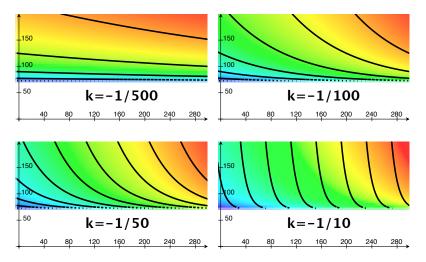

IVP:
$$\frac{dy}{dt} = k(y - 70),$$
 $y(0) = 370,$ $y(10) = 340$
General solution: $y = Ae^{kt} + 70$

What do we expect from k and A? A > 0, k < 0

IVP:
$$\frac{dy}{dt} = k(y - 70),$$
 $y(0) = 370,$ $y(10) = 340$
General solution: $y = Ae^{kt} + 70$

IVP:
$$\frac{dy}{dt} = k(y - 70),$$
 $y(0) = 370,$ $y(10) = 340$
General solution: $y = Ae^{kt} + 70$

Step 3: Plug in points and find particular solution

IVP:
$$\frac{dy}{dt} = k(y - 70),$$
 $y(0) = 370,$ $y(10) = 340$
General solution: $y = Ae^{kt} + 70$

Step 3: Plug in points and find particular solution

$$370 = y(0) = Ae^0 + 70$$
, so $A = 300$

IVP:
$$\frac{dy}{dt} = k(y - 70),$$
 $y(0) = 370,$ $y(10) = 340$
General solution: $y = Ae^{kt} + 70$

Step 3: Plug in points and find particular solution

,

$$370 = y(0) = Ae^0 + 70,$$
 so $A = 300$

$$340 = y(10) = 300e^{k*10} + 70$$

so
$$k = \frac{1}{10} \ln \left(\frac{350 - 70}{300} \right) = \left[\frac{\ln(.9)}{10} \approx -0.0105 \right]$$

IVP:
$$\frac{dy}{dt} = k(y - 70),$$
 $y(0) = 370,$ $y(10) = 340$
General solution: $y = Ae^{kt} + 70$

Step 3: Plug in points and find particular solution

$$370 = y(0) = Ae^0 + 70,$$
 so $A = 300$

$$340 = y(10) = 300e^{k*10} + 70$$

so
$$k = \frac{1}{10} \ln \left(\frac{350 - 70}{300} \right) = \boxed{\ln(.9)/10 \approx -0.0105}$$

So the particular solution is

,

$$y = 300e^{t * \ln(.9)/10} + 70$$

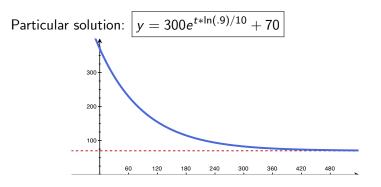

Example 2: Objects heat or cool at a rate proportional to the difference between their temperature and the ambient temperature. Suppose a pie is pulled out of the oven (heated to 370° F), and put into a room that's 70° F. After 10 minutes, the center of the pie is 340° F.

- (a) How hot is the pie after 20 minutes?
- (b) How long will it take for the center of the pie to cool to 100°F?

Particular solution: $y = 300e^{t \cdot \ln(.9)/10} + 70$

Example 2: Objects heat or cool at a rate proportional to the difference between their temperature and the ambient temperature. Suppose a pie is pulled out of the oven (heated to 370° F), and put into a room that's 70° F. After 10 minutes, the center of the pie is 340° F.

- (a) How hot is the pie after 20 minutes?
- (b) How long will it take for the center of the pie to cool to 100°F?

Example 2: Objects heat or cool at a rate proportional to the difference between their temperature and the ambient temperature. Suppose a pie is pulled out of the oven (heated to 370° F), and put into a room that's 70° F. After 10 minutes, the center of the pie is 340° F.

- (a) How hot is the pie after 20 minutes?
- (b) How long will it take for the center of the pie to cool to 100°F?

Particular solution:
$$y = 300e^{t + \ln(.9)/10} + 70$$

Answers:

(a)
$$y(20) = 300e^{20*\ln(.9)/10} + 70 = 313$$

Example 2: Objects heat or cool at a rate proportional to the difference between their temperature and the ambient temperature. Suppose a pie is pulled out of the oven (heated to 370°F), and put into a room that's 70°F. After 10 minutes, the center of the pie is 340°F.

- (a) How hot is the pie after 20 minutes?
- (b) How long will it take for the center of the pie to cool to 100°F?

Particular solution: $y = 300e^{t \cdot \ln(.9)/10} + 70$

Answers:

(a)
$$y(20) = 300e^{20*\ln(.9)/10} + 70 = 313$$

(b) $100 = 300e^{t \cdot \ln(.9)/10} + 70$

So
$$e^{t * \ln(.9)/10} = 30/300 = 1/10$$
,

Example 2: Objects heat or cool at a rate proportional to the difference between their temperature and the ambient temperature. Suppose a pie is pulled out of the oven (heated to 370°F), and put into a room that's 70°F. After 10 minutes, the center of the pie is 340°F.

- (a) How hot is the pie after 20 minutes?
- (b) How long will it take for the center of the pie to cool to 100°F?

Particular solution:
$$y = 300e^{t + \ln(.9)/10} + 70$$

Answers:

(a)
$$y(20) = 300e^{20*\ln(.9)/10} + 70 = 313$$

(b) $100 = 300e^{t \cdot \ln(.9)/10} + 70$

So
$$e^{t * \ln(.9)/10} = 30/300 = 1/10$$
, and so
 $t = \frac{10}{\ln(.9)} \ln(.1) \approx \boxed{218.543}$

IVP:
$$\frac{dy}{dt} = ky$$
,

IVP:
$$\frac{dy}{dt} = ky$$
, $y(0) = 10$, $y(24.1) = \frac{1}{2}10$.

IVP:
$$\frac{dy}{dt} = ky$$
, $y(0) = 10$, $y(24.1) = \frac{1}{2}10$.
Question: What is t when $y(t) = 1$?

"Half-life": The time it takes for an amount of stuff to halve in size.

IVP:
$$\frac{dy}{dt} = ky$$
, $y(0) = 10$, $y(24.1) = \frac{1}{2}10$.

Question: What is t when y(t) = 1?

To do:

Separate to get general solution; Plug in points to get specific solution; Solve y(t) = 1 for t
