

Warmup

Fill in the blank:

1. Since $\frac{d}{dx} \cos(x^2 + 1) = \underline{\hspace{2cm}}$,
so $\int \underline{\hspace{2cm}} dx = \cos(x^2 + 1) + C.$

2. Since $\frac{d}{dx} \ln |\cos(x)| = \underline{\hspace{2cm}},$
so $\int \underline{\hspace{2cm}} dx = \ln |\cos(x)| + C.$

(Example: $\frac{d}{dx} x^3 dx = 3x^2$, so $\int 3x^2 dx = x^3 + C.$)

Undoing chain rule

In general:

$$\frac{d}{dx} f(g(x)) = f'(g(x)) * g'(x),$$

so $\int f'(g(x)) * g'(x) dx = f(g(x)) + C.$

Example: Calculate the (extremely suggestively written) integral

$$\int \cos(x^3 + 5x - 10) * (3x^2 + 5 * 1 + 0) dx$$

Less obvious chain rules.

Look for a buried function $g(x)$ and it's derivative $g'(x)$ which can be paired with dx :

Examples:

$$\int \frac{\cos(x)}{\sin(x) + 1} dx = \int \frac{1}{\sin(x) + 1} * \cos(x) dx$$

$$\int x \sqrt{x^2 + 1} dx = \int \frac{1}{2} \sqrt{x^2 + 1} * 2x dx$$

$$\int \frac{\cos(\sqrt{x})}{2\sqrt{x}} dx = \int \cos(\sqrt{x}) * \frac{1}{2\sqrt{x}} dx$$

Method of Substitution

Look for a buried function $g(x)$ and it's derivative $g'(x)$ which can be paired with dx .

Example: $\int \frac{\cos(x)}{\sin(x) + 1} dx$

Let $u = g(x)$.

Let $u = \sin(x) + 1$

Calculate du .

$$\frac{du}{dx} = \cos(x) \text{ so } du = \cos(x) dx$$

Clear out all of the x 's,
replacing them with u 's.

$$\int \frac{1}{u} du$$

Calculate the new integral.

$$\int \frac{1}{u} du = \ln|u| + C$$

Substitute back into x 's.

$$\ln|u| + C = \ln|\sin(x) + 1| + C$$

$$\text{Check } \frac{d}{dx} \ln|\sin(x) + 1| + C = \frac{1}{\sin(x)+1} * \cos(x) \checkmark$$

Method of Substitution

Look for a buried function $g(x)$ and it's derivative $g'(x)$ which can be paired with dx .

Example: $\int x\sqrt{x^2 + 1} dx$

Let $u = g(x)$.

Let $u = x^2 + 1$

Calculate $c * du$.

$$\frac{du}{dx} = 2x \text{ so } \frac{1}{2}du = x dx$$

Clear out all of the x 's,
replacing them with u 's.

$$\int \sqrt{u} * \frac{1}{2}du$$

Calculate the new integral.

$$\frac{1}{2} \int u^{1/2} du = \frac{1}{2} \left(\frac{2}{3} u^{3/2} \right) + C$$

Substitute back into x 's.

$$= \frac{1}{3}(x^2 + 1)^{3/2} + C$$

$$\text{Check } \frac{d}{dx} \frac{1}{3}(x^2 + 1)^{3/2} + C = \frac{1}{3} \cdot \frac{3}{2}(x^2 + 1)^{1/2} * 2x \checkmark$$

Method of Substitution

Look for a buried function $g(x)$ and it's derivative $g'(x)$ which can be paired with dx .

Example: $\int \frac{e^{\sqrt{x}}}{\sqrt{x}} dx$

Let $u = g(x)$.

Let $u = \sqrt{x}$

Calculate $c * du$.

$$\frac{du}{dx} = \frac{1}{2\sqrt{x}} \text{ so } 2du = \frac{1}{\sqrt{x}} dx$$

Clear out all of the x 's,
replacing them with u 's.

$$\int e^u * 2du$$

Calculate the new integral.

$$2 \int e^u du = 2e^u + C$$

Substitute back into x 's.

$$= 2e^{\sqrt{x}} + C$$

$$\text{Check } \frac{d}{dx} 2e^{\sqrt{x}} + C = 2e^{\sqrt{x}} * \frac{1}{2} \frac{1}{\sqrt{x}} \checkmark$$

Method of Substitution

Look for a buried function $g(x)$ and its derivative $g'(x)$ which can be paired with dx .

Example: $\int \frac{2x}{\sqrt[3]{x^2 + 1}} dx$

Let $u = g(x)$.

Let $u = x^2 + 1$

Calculate $c * du$.

$$\frac{du}{dx} = 2x \quad \text{so} \quad du = 2x \, dx$$

Clear out all of the x 's,
replacing them with u 's.

$$\int \frac{1}{\sqrt[3]{u}} du = \int u^{-1/3} du$$

Calculate the new integral.

$$\int u^{-1/3} du = \frac{3}{2}u^{2/3} + C$$

Substitute back into x 's.

$$= \frac{3}{2}(x^2 + 1)^{2/3} + C$$

$$\boxed{\text{Check } \frac{d}{dx} \frac{3}{2}(x^2 + 1)^{2/3} + C = \frac{3}{2} \cdot \frac{2}{3}(x^2 + 1)^{-1/3} \cdot 2x \checkmark}$$

Same integral, different substitution!

Look for a buried function $g(x)$ and its derivative $g'(x)$ which can be paired with dx .

Example: $\int \frac{2x}{\sqrt[3]{x^2 + 1}} dx$

Let $u = g(x)$.

Let $u = \sqrt[3]{x^2 + 1}$

Calculate $c * du$.

$$\frac{du}{dx} = \frac{1}{3}(x^2 + 1)^{-2/3} \cdot 2x$$

Uh oh? Let's try to force it!! Cross-multiply:

$$2x dx = \frac{du}{\frac{1}{3}(x^2 + 1)^{-2/3}} = 3(x^2 + 1)^{2/3} du = 3u^2 du.$$

Yay!! So

$$\begin{aligned} \int \frac{2x}{\sqrt[3]{x^2 + 1}} dx &= \int \frac{3u^2}{u} du = 3 \int u \, du = \frac{3}{2}u^2 + C \\ &= \frac{3}{2}(\sqrt[3]{x^2 + 1})^2 + C = \frac{3}{2}(x^2 + 1)^{2/3} + C, \end{aligned}$$

just like before!

You try: Compute the following using substitution. Check your answer each time by taking a derivative.

$$1. \int (3x + 7)^5 \, dx$$

$$2. \int \sqrt{5x - 9} \, dx$$

$$3. \int \frac{1}{\sqrt{4x + 3}} \, dx$$

$$4. \int \frac{1}{\sqrt{3 - 4x}} \, dx$$

$$5. \int \frac{x + 1}{x^2 + 2x - 3} \, dx$$

$$6. \int \frac{4x - 5}{2x^2 - 5x + 1} \, dx$$

$$7. \int \frac{2x + 3}{\sqrt{x^2 + 3x - 2}} \, dx$$

$$8. \int \frac{dx}{\sqrt{1 - 3x} - \sqrt{5 - 3x}}$$

$$9. \int \frac{x^2}{1 + x^6} \, dx$$

$$10. \int (1 - x)\sqrt{1 + x} \, dx$$

$$11. \int \sin 3x \, dx$$

$$12. \int \csc^2(2x + 5) \, dx$$

$$13. \int \sin x \cos x \, dx$$

$$14. \int \sin^3 x \cos x \, dx$$

$$15. \int \frac{\cos \sqrt{x}}{\sqrt{x}} \, dx$$
