Generating functions are useful in studying the number of different types of partitions of an integer *n*. A **partition** of a positive integer is a way to write this integer as the sum of positive integers where repetition is allowed and the order of the integers in the sum does not matter. For example, the partitions of 5 (with no restrictions) are 1 + 1 + 1 + 1 + 1, 1 + 1 + 1 + 2, 1 + 1 + 3, 1 + 2 + 2, 1 + 4, 2 + 3, and 5. Exercises 51–56 illustrate some of these uses.

- **53.** Show that the coefficient $p_d(n)$ of x^n in the formal power series expansion of $(1 + x)(1 + x^2)(1 + x^3) \cdots$ equals the number of partitions of *n* into distinct parts, that is, the number of ways to write *n* as the sum of positive integers, where the order does not matter but no repetitions are allowed.
- **54.** Find $p_o(n)$, the number of partitions of *n* into odd parts with repetitions allowed, and $p_d(n)$, the number of partitions of *n* into distinct parts, for $1 \le n \le 8$, by writing each partition of each type for each integer.
- **55.** Show that if *n* is a positive integer, then the number of partitions of *n* into distinct parts equals the number of partitions of *n* into odd parts with repetitions allowed;
